

DBIM SESSION 2 — HANDS-ON WORKSHEET

Business Prioritization, ROI Logic & the Use-Case Pitch

Weighted Impact Scoring • Value Mapping & ROI • Discovery → Rationalization → Pitch Workshop

Field	Fill in
Name(s)	Ramachandrapurapu Mahima Varshini
Group / Team	Team 13
Date	1-10-2026
Real organization continued from Session 1	KLU Campus IT / Student IT Support

Before you start

This worksheet continues directly from your Session 1 worksheet. Keep that document open — you'll pull your Employee Onboarding value chain (Part B) and your rationalization scores (Part C) into Part A here. Part D is again the real-organization capstone, continuing what you started in Session 1's Part D.

- Part A – Weighted Priority Scoring (12 min, individual or pairs)
- Part B – Value Mapping Canvas + ROI + Feasibility (15 min, individual or pairs)
- Part C – Discovery → Rationalization → Live Pitch Workshop (~50 min, groups of 3–4)
- Part D – Capstone: Real-World Application, continued (take-home, groups of 3–4)

Part A — Weighted Priority Scoring

Bring in your Employee Onboarding value chain from Session 1, Worksheet Part B (your 4–6 bite-sized use cases). Score every one on all five factors below, then apply the weighted formula.

Reference — the formula from the slides

Priority Score = (Impact × 3) + (Feasibility × 2) + (Strategic Alignment × 2) + (Urgency × 1) – (Risk × 1). In the TechNova example, Password reset auto-resolve scored 5/5/5/4/1 for a weighted total of 38 — clearly ahead of the next-best candidate at 27.

Your task: weighted-score your onboarding use cases

Use case	Impact ×3	Feas. ×2	Align. ×2	Urg. ×1	Risk –1	Weighted Total
New Hire Information Collection	5	5	5	5	1	39
Automated Account Setup	5	4	5	4	1	36
Laptop Provisioning Tracker	5	4	5	4	2	35
Employee Access Provisioning	5	3	5	4	2	33
Onboarding Task & Status Tracking	4	5	5	4	1	35

Reflection

Did any use case's rank change between your Session 1 simple score and today's weighted score? Which one, and why did the weighting move it?

Yes. The ranking changed slightly after applying the weighted formula. Automated Account Setup moved ahead of Laptop Provisioning Tracker because the weighted scoring gives more importance to business impact, feasibility and strategic alignment, while also considering urgency and risk. New Hire Information Collection remained the top use case because it has high impact, strong feasibility and low risk.

Part B — Value Mapping, ROI & Feasibility

Take your #1 weighted-priority use case from Part A. Build out its full value mapping canvas, then estimate ROI and score feasibility — exactly as we did for TechNova's password reset bot.

Reference — the TechNova ROI math from the slides

Monthly savings: $4,340 \text{ tickets} \times \$19 = \$82,460$. Annual value: $\$989,520$. Build cost: $\sim \$74,000$. ROI: $(989,520 - 74,000) \div 74,000 \approx 12.4\times$. Payback: ~ 27 days. It's fine if your numbers are rougher — state your assumptions clearly.

B1. Value Mapping Canvas

Field	Your answer
Business Goal	Improve the employee onboarding process by collecting complete and accurate new-hire information in one place and reducing manual follow-ups.
Use Case	Implement a centralized digital system for collecting and validating all required new-hire information before the onboarding process begins.
KPI	Reduce manual follow-ups for missing employee information by 50% within 8–10 weeks.
Value Delivered (in \$ or time)	Save HR staff time by reducing repeated emails, manual data entry and follow-ups, while improving the completeness and accuracy of employee onboarding information.

B2. ROI Calculation

Line item	Your estimate
Monthly savings / value (show your math)	$50 \text{ new hires} \times 0.5 \text{ hour saved} \times ₹300/\text{hour} = ₹7,500/\text{month}$
Annual value delivered	$₹7,500 \times 12 = ₹90,000 \text{ per year}$
Estimated build cost (8–10 wk sprint)	₹40,000 for an 8–10 week pilot
ROI = (Annual value – Build cost) ÷ Build cost	$(₹90,000 - ₹40,000) \div ₹40,000 = 1.25\times (125\%)$
Payback period	$₹40,000 \div ₹7,500 = 5.33 \text{ months}$

B3. Feasibility Check (score 1–5 each)

Lens	Score (1–5)	Why
Technical	5	The solution can be implemented using a web form, database and basic validation workflow without requiring highly complex technology.
Data	4	Required employee information can be collected through the system, but existing onboarding records may need standardization and validation.

Lens	Score (1–5)	Why
Organizational	4	HR and new employees can use a centralized process, but users will need clear instructions and adoption support during the pilot.

Weakest lens and the biggest risk it creates for this use case:

Data is the weakest lens. The biggest risk is incomplete or inconsistent employee information, which could reduce the accuracy of the onboarding process and require additional validation.

Part C — Discovery → Rationalization → Pitch Workshop

Same groups as Session 1. New problem area: TechNova's IT asset & equipment request backlog (laptops, monitors, software licenses, replacement parts — currently a mix of email requests and a shared spreadsheet, no SLA, frequent duplicate orders).

Step 1 (8 min) — Discovery + Weighted Rationalization

#	Candidate use case (one line)
1	Centralized Equipment Request Submission
2	Request Classification
3	Automatic Request Assignment
4	Inventory Availability Check
5	Duplicate Request Detection
6	Request Status & SLA Tracking(Service Level Agreement)

Candidate	Impact ×3	Feas. ×2	Align. ×2	Urg. ×1	Risk −1	Weighted Total
Centralized Equipment Request Submission	5	5	5	5	1	39
Request Classification	4	5	5	4	1	36
Automatic Request Assignment	5	4	5	4	2	35
Inventory Availability Check5	5	4	5	5	2	37
Duplicate Request Detection	4	4	4	4	2	30
Request Status & SLA Tracking	5	5	5	5	1	39

Step 2 (10 min) — Value Mapping + ROI for your top pick

Field	Your answer
Business Goal	Reduce equipment request backlog, duplicate orders and manual coordination
Use Case	Centralize equipment requests through a structured digital request system.
KPI	Reduce average request-processing time by 30% within 8–10 weeks.

Field	Your answer
Value Delivered	Reduce manual coordination, duplicate requests and request-tracking effort.
Estimated ROI	Use the assumptions discussed by your group during the workshop.

Step 3 (3 min per group) — Write your pitch script

Part	Your script (1–2 sentences each)
1. Problem	TechNova currently manages equipment requests through emails and a shared spreadsheet, causing delays, duplicate orders and poor visibility into request status.
2. Use Case	We propose a centralized equipment request system that captures requests in a structured format and provides a single place to track them.
3. Value & ROI	The solution can reduce manual coordination and duplicate requests while improving processing efficiency. The expected value can be measured against the implementation cost using the estimated ROI.
4. Feasibility	The solution is technically feasible using a web-based request form, database and workflow. The main requirements are reliable equipment data and user adoption
5. The Ask	We request approval for an 8–10 week pilot with a small technical team and access to current equipment-request and inventory data.

Step 4 — Peer scoring (fill in for OTHER groups' pitches)

Group pitching	Clarity (1–5)	Evidence (1–5)	Feasibility (1–5)	Total

Part D — Capstone: Continue Your Real-World Use Case

Return to the real organization and use case you developed in Session 1's Part D. Complete the same journey you just practiced on TechNova: weighted score, value map, ROI, feasibility, and a written pitch.

D1. Weighted Priority Score

Re-score your Session 1 candidates (Part D3) with all five weighted factors.

Candidate	Impact ×3	Feas. ×2	Align. ×2	Urg. ×1	Risk –1	Weighted Total
IT Request Submission	5	5	5	5	1	39
Issue Classification	4	5	5	4	1	36
Automatic Request Assignment	5	4	5	4	2	35
Request Status Tracking	5	5	5	4	1	38
Resolution Feedback	3	5	4	3	1	27
Password Reset Support	5	5	4	4	1	36
Wi-Fi / Network Issue Reporting	5	4	5	5	2	36
Software Installation Request	4	4	4	3	2	29

D2. Value Mapping Canvas

Field	Your answer
Business Goal	Improve student IT support by reducing manual request handling, delays and repeated follow-ups.
Use Case	Implement a centralized Student IT Request Submission system where students can submit structured IT issues and track their requests.
KPI	Reduce average manual handling time per IT request by 10 minutes and achieve at least 90% of student IT requests through the centralized system within 8–10 weeks.
Value Delivered	Save approximately 50 staff hours per month by reducing manual request handling and follow-ups, while improving visibility and transparency for students and support staff.

D3. ROI & Feasibility

Line item		Your estimate
Monthly / annual value (show your math)		$300 \times 10 \text{ minutes} = 3,000 \text{ minutes}$ $3,000 \div 60 = \mathbf{50 \text{ hours/month}}$ $50 \times ₹300 = \mathbf{₹15,000/month}$ Annual value $₹15,000 \times 12 = \mathbf{₹1,80,000/year}$
Estimated build cost		₹60,000 for an 8–10 week pilot
ROI		$(₹1,80,000 - ₹60,000) \div ₹60,000$ $= ₹1,20,000 \div ₹60,000$ $= \mathbf{2.0 \times 200\%}$
Payback period		$₹60,000 \div ₹15,000 = \mathbf{4 \text{ months}}$
Lens	Score (1–5)	Why
Technical	5	A centralized request form, database and workflow can be implemented using standard web and database technologies.
Data	4	Student details, issue categories and request status can be collected, but existing support records may require standardization.
Organizational	4	Students and IT staff can use a structured request process, but adoption will require clear communication and support.

D4. Written Pitch (5 parts, ~150 words total)

Part	Your script
1. Problem	Student IT issues can require manual communication and follow-ups, making it difficult to track requests and their current status.
2. Use Case	We propose a centralized Student IT Request Submission system where students can submit structured IT issues and track requests from submission to resolution.
3. Value & ROI	Assuming 300 requests per month and 10 minutes saved per request, the solution can save around 50 staff hours monthly, valued at approximately ₹15,000 per month. With an estimated build cost of ₹60,000, the annual

Part	Your script
	value is ₹1.8 lakh, giving an estimated 2.0× ROI and a four-month payback period.
4. Feasibility	The solution is technically feasible using a web-based form, database and workflow. The main risks are inconsistent existing support data and user adoption.
5. The Ask	We request approval for an 8–10 week pilot with a small development team and an estimated budget of ₹60,000 to implement and evaluate the solution.

Grading Rubric

Deliverable	What we're looking for	Weight
Weighted Priority Score (Part D1)	All 5 factors scored honestly, weights applied correctly, ranking justified	20%
Value Mapping Canvas (Part D2)	Clear goal → use case → KPI → value chain, KPI is genuinely measurable	20%
ROI & Feasibility (Part D3)	Reasonable stated assumptions, math shown, all 3 feasibility lenses covered	25%
Written / Live Pitch (Part D4)	Hits all 5 pitch parts, fits the time limit, evidence-based, not just enthusiasm	35%

Submit this worksheet (Parts A–D completed) before Session 3.
